

AI Calling Lead Generation Agent – Workflow Overview

This automation workflow is designed to streamline the process of contacting leads via AI-powered calls, tracking responses, and notifying team members. It integrates multiple tools like Airtable, Vapi, Google Drive, and Gmail.

Workflow Breakdown:

- Schedule Trigger**
The automation begins with a scheduled trigger that runs at a defined time interval (e.g., daily).
- Airtable – Search Record**
It searches the Airtable database for new or unprocessed lead records.
- Loop Over Items**
Each lead record is processed individually in a loop to ensure all leads are handled.
- Vapi – AI Calling**
For each lead, a call is initiated using [Vapi.ai](https://vapi.ai), which uses AI to interact with the lead and gather responses.
- Update Airtable Record**
After the call, the lead's record in Airtable is updated with the call status or response details.
- Google Drive – Download File**
If needed (e.g., for call recordings or supporting documents), a related file is fetched from Google Drive.
- Send Gmail**
A follow-up or summary email is sent via Gmail to the team or the lead based on the call outcome.
- Wait**
A delay is added to throttle the process or wait before the next interaction (useful for rate-limiting or pacing calls).

Tools Used:

- **Airtable** – CRM database for storing and updating lead info
- **Vapi.ai** – AI-based voice interaction for making calls
- **Google Drive** – Access and share documents
- **Gmail** – Automate email notifications
- **n8n** – Orchestration platform for low-code automation
