

Blogs Automation with JTL WebApp – Workflow Overview

This workflow automates the generation and publishing of blog content using an AI agent integrated with JTL's web app, leveraging tools like Airtable, OpenAI, and HTTP endpoints.

Workflow Breakdown:

1.  **Schedule Trigger**
The automation starts on a scheduled interval, initiating the process regularly (e.g., daily or weekly).
 2.  **Airtable – Search Record**
It pulls new blog prompts, topics, or content outlines stored in Airtable.
 3.  **AI Agent – Tools Agent**
The AI agent processes the data using:
 - Context memory from previous chat interactions
 - Outputs from the OpenAI Chat Model
 - Parsing logic for structured formatting
 4.  **OpenAI Chat Model**
Generates blog content from the input topics using GPT-style generation based on the context.
 5.  **Structured Output Parser**
Ensures that the AI-generated content is correctly formatted for downstream tasks (e.g., markdown, HTML, metadata).
 6.  **Loop Over Items**
Each structured blog post is processed individually in a loop.
 7.  **HTTP Request**
Sends the formatted blog post to an external web service or CMS endpoint (e.g., to publish on a website via an API).
-

Tools Used:

- Airtable – Content repository for blog prompts
- OpenAI Chat Model – Blog content generation using GPT
- AI Agent (Tools Agent) – Coordinates context, calls models, and parses results
- Structured Output Parser – Ensures reliable, usable blog content structure
- HTTP Node – Automates blog publishing or saving via API
- n8n – No-code orchestration platform used to build this flow
