

Email Leads Automations with Advanced Personalization – Workflow Overview

This automation leverages webhook triggers, vector databases, and generative AI models to respond to leads with highly personalized emails based on uploaded documents and prior interactions. The process includes semantic search, document embedding, and advanced message composition.

Workflow Breakdown

1.  Webhook
The flow begins when a webhook is triggered—typically by an incoming lead or customer query.
2.  Gmail – Get Emails
Retrieves the incoming email or lead message that triggered the webhook.
3.  Send Data → Customer Support Agent
Data is forwarded to a customer support AI agent that parses, classifies, and routes based on context.
4.  Switch
Routes leads based on the nature of the message—for example, whether the inquiry is sales, support, or general.

Upload Policies to Pinecone (Document Vectorization Module)

5.  Policies and FAQs → Convert to File
Existing documents (e.g., policy PDFs or FAQs) are converted into structured file format.
6.  Convert File to Embeddings → OpenAI
The documents are passed through an embedding model to convert them into vector format.
7.  Pinecone – Insert Vectors
Vectors are stored in Pinecone for semantic retrieval during conversation.
8.  Default Data Loader & Recursive Character Text Splitter
Handles large document chunking and ensures proper formatting for vector search.

Create and Send Email (Personalization Engine)

9.  Customer Support Agent
Retrieves context and composes personalized content using structured memory and user information.
10.  Pinecone Vector Store + Google Gemini Chat
Uses the Pinecone vector store to retrieve the most relevant document snippets and passes them to the Gemini Chat Model to generate tailored responses.
11.  Google Gemini Chat – Compose Email
Final email content is created with natural tone and reference to contextual documents.
12.  Gmail – Send Email
The personalized email is sent to the lead, creating a smooth and intelligent customer experience.
13.  End Data
Closes the workflow after successful delivery.

Tools & Technologies Used:

- Gmail – For reading and sending lead emails
- OpenAI & Gemini Chat – For understanding, generating and responding intelligently
- Pinecone – Vector database for semantic search on policy documents
- Webhook – External event trigger
- n8n – Automation and orchestration platform
- Recursive Character Text Splitter – For chunking large documents for vectorization
