

# Meme Generator Workflow – Overview

This workflow automates the process of creating memes, music videos, and reaction mashups by orchestrating file handling, AI-powered generation, and media processing in a structured loop. It integrates with Google Drive and uses multimedia editing nodes for combining visuals and audio into engaging content.

---

## Workflow Structure

The workflow is organized into four logical sections:

1.  Trigger & Initialization
    - The automation starts when a user triggers the workflow (e.g., clicking a "Test" button).
    - This launches the parallel generation of memes, music content, and reaction content.
- 

2.  Music Videos Section (Top – Purple Zone)
    -  Google Drive (Music Folder)  
Retrieves available music files from a specific folder.
    -  Search Music File  
Selects music files to use in content creation.
    -  Loop Over All Music  
Iterates through each music file for batch processing.
    -  Write Music File  
Saves or exports the final music file into a destination folder.
- 

3.  Memegen Section (Middle Left – Red Zone)
    -  Generate Meme Text  
Uses logic or an AI model to generate funny or relevant meme text.
    -  Store Meme Text  
Stores the meme text for later use in video overlays or meme assets.
- 

4.  Reaction Videos Section (Middle – Green Zone)
  -  Google Drive (Reactions Folder)  
Accesses a library of reaction clips stored in Drive.
  -  Search Reaction Video  
Locates relevant reaction videos to pair with memes/music.
  -  Loop Over All Reactions  
Iterates over each selected reaction video.
  -  Write Reaction Video  
Saves or exports the final reaction video.

- 
5.  Loop Engine & Assembly (Bottom – Olive Zone)
-  Loop Control
    - Loops 5 times for memes.
    - Loops 40 times for each music entry.
  -  Pre-select Reaction Clip  
Chooses a reaction video to pair with meme/music.
  -  Overlay Meme Text  
Adds meme text as overlay to the reaction video.
  -  Draw Text + Mux Audio  
Adds text and synchronizes audio with video.
  -  Write Files in Binary  
Converts edited content into binary format (read from disk).
  -  Save Output  
Stores the final compiled file into Drive or output location.
  -  MEME LOOP / MUSIC LOOP  
These nodes control the repetition cycle and continue until all combinations are exhausted.
- 

## Tools & Technologies Used:

- Google Drive – File retrieval and storage
- Media Tools – Audio muxing, video editing, binary writing
- AI or Logic-based Generators – Meme text creation
- n8n – Low-code orchestration for automation logic
