

Reddit Content Filter & Notifier Workflow – Overview

This automation scans Reddit for new posts based on defined criteria, filters out duplicates, processes the posts through an AI model for enrichment or classification, and then notifies users or logs the data via Airtable, messaging platforms, or spreadsheets.

Workflow Breakdown

1.  **Schedule Trigger**
The workflow runs on a regular schedule to scan for updates without manual input.
 2.  **Get Reddit Posts**
Retrieves recent posts using the Reddit API based on keywords, subreddits, or other filters.
 3.  **Remove Duplicates**
 - Previous1 & Current1 filters are used to identify and eliminate already processed content.
 - Ensures no repeated processing of the same posts.
 4.  **Conditional Filtering**
Posts are filtered through two logic gates (Filter2 and Filter3) to retain only relevant content based on custom criteria.
 5.  **Loop Over Items**
Processes each valid Reddit post individually to allow precise handling.
 6.  **Message a Model (OpenAI or custom ML)**
Each post is analyzed, summarized, or categorized using a generative AI model.
 7.  **Code Node (Code3)**
Custom transformation or formatting is applied to the post+AI output—like tagging, URL formatting, or scoring.
 8.  **Conditional Branch (if2)**
Routes data to the appropriate output based on AI output or content attributes.
-

Output Actions

9.  **Create a Record – Airtable**
Posts are stored in an Airtable base for logging, collaboration, or dashboarding.
 10.  **Create a Row – Google Sheets**
Simultaneously logs the data into a spreadsheet for backup or reporting.
 11.  **Send SMS/MMS/WhatsApp**
Sends an alert to subscribed users when a matching or important post is found.
-

Advanced Features

- Deduplication logic for avoiding reposts
- AI analysis to auto-label, summarize, or filter posts
- Conditional logic for smart notifications
- Multi-output (Airtable, Google Sheets, SMS) for flexibility
